

Turning the printer on

The printer not turning off can either be a very simple problem, or a very serious problem that might cost money to fix.

Written By: Joe

INTRODUCTION

This will tell you how to go from a printer that won't turn on to one that will.

Step 1 — Turning the printer on

- Inspect the printer to see if there are any visible damages to it.

Step 2

- Plug in the power cord tightly to the back of the printer and into an AC power source.

Step 3

- Check to see if any power is now coming through.

Step 4

- Check to see the cord is in snug enough. You should be able to hear a moderate click.

Step 5

- Check the wire for strips or possibly defects.

Step 6

- Consider buying a new printer cord or testing with someone who has a working one. If this still does not work, your printer may have internal damages beyond fixing.

To reassemble your device, follow these instructions in reverse order.
